Country overview

Malnutrition burden

Guinea is on course to meet the global target for infant exclusive breastfeeding, but is off course to meet the targets for all other indicators analysed with adequate data. There is insufficient target data to assess Guinea’s progress for low birth weight.

Although it performs relatively well against other developing countries, Guinea still experiences a malnutrition burden among its under-five population. As of 2016, the national prevalence of under-five overweight is 4%, which has increased slightly from 3.8% in 2012. The national prevalence of under-five stunting is 32.4%, which is greater than the developing country average of 25%. Conversely, Guinea’s under-five wasting prevalence of 8.1% is less than the developing country average of 8.9%.

In Guinea, 33.4% of infants under 6 months are exclusively breastfed. There is insufficient data on low birth weight.

Guinea’s adult population also face a malnutrition burden. 50.6% of women of reproductive age have anaemia, and 6.8% of adult men have diabetes, compared to 6.1% of women. Meanwhile, 11.5% of women and 3.7% of men have obesity.

Notes: Data on the adult indicators are based on modelled estimates.

Progress against global nutrition targets 2019

Notes: WRA = Women of a reproductive age; NA = not applicable. The methodologies for tracking differ between targets. Data on the adult indicators are based on modelled estimates.
Child (under-five) nutrition status

Coexistence of wasting, stunting and overweight

Notes: Percentage of children under-five years of age who experience different and overlapping forms of malnutrition.

Low birth weight

No data

Prevalence of under-five stunting

Stunting at subnational level

Notes: 5 km level map shows prevalence at the 5 x 5-km resolution. Prevalence is the 2017 estimated prevalence, based on a model using a range of surveys between 1998-2018. See source paper for full methods.
