Country overview

Malnutrition burden

Haiti is on course to meet the global targets for under-five overweight and under-five wasting, but is off course to meet the targets for under-five stunting, infant exclusive breastfeeding, anaemia in women of reproductive age, male diabetes, and female diabetes. There is insufficient target data to assess Haiti’s progress for low birth weight, male obesity, and female obesity.

Although it performs well against other developing countries, Haiti still experiences a malnutrition burden among its under-five population. As of 2017, the national prevalence of under-five overweight is 3.4%, which has decreased slightly from 3.6% in 2012. The national prevalence of under-five stunting is 21.9%, which is less than the developing country average of 25%. Haiti’s under-five wasting prevalence of 3.7% is also less than the developing country average of 8.9%.

In Haiti, 39.9% of infants under 6 months are exclusively breastfed, this is well above the Caribbean average of 26%. There is insufficient data on low birth weight.

Haiti’s adult population also face a malnutrition burden. 46.2% of women of reproductive age have anaemia, and 8.8% of adult women have diabetes, compared to 8.6% of men. Meanwhile, 26.9% of women and 17.9% of men have obesity.

Notes: Data on the adult indicators are based on modelled estimates.

Progress against global nutrition targets 2019

- Under-five stunting: No progress or worsening
- Under-five wasting: On course
- Under-five overweight: On course
- Low birthweight: No data
- Exclusive breastfeeding: No progress or worsening
- Adult female obesity: No data
- Adult male obesity: No data
- Adult female diabetes: No progress or worsening
- Adult male diabetes: No progress or worsening
- WRA anaemia: No progress or worsening

Notes: WRA = Women of a reproductive age; NA = not applicable. The methodologies for tracking differ between targets. Data on the adult indicators are based on modelled estimates.
Child (under-five) nutrition status

Coexistence of wasting, stunting and overweight

Notes: Percentage of children under-five years of age who experience different and overlapping forms of malnutrition.

Low birth weight

No data

Prevalence of under-five stunting

Stunting at subnational level

Stunting at 5km level

Notes: 5 km level map shows prevalence at the 5 x 5-km resolution. Prevalence is the 2017 estimated prevalence, based on a model using a range of surveys between 1998-2018. See source paper for full methods.
