## Country overview

### Malnutrition burden

Liberia is on course to meet the global target for under-five stunting, but is off course to meet the targets for under-five wasting, anaemia in women of reproductive age, male diabetes, female diabetes, male obesity, and female obesity. There is insufficient target data to assess Liberia's progress for under-five overweight, infant exclusive breastfeeding, and low birth weight.

Although it performs relatively well against other developing countries, Liberia still experiences a malnutrition burden among its under-five population. As of 2013, the national prevalence of under-five overweight is 3.2%, which has decreased slightly from 4.2% in 2007. The national prevalence of under-five stunting is 32.1%, which is greater than the developing country average of 25%. Conversely, Liberia's under-five wasting prevalence of 5.6% is less than the developing country average of 8.9%.

In Liberia, 54.6% of infants under 6 months are exclusively breastfed, this is well above the Western Africa average of 32.5%. There is insufficient data on low birth weight.

Liberia's adult population also face a malnutrition burden. 34.7% of women of reproductive age have anaemia, and 7.8% of adult men have diabetes, compared to 7.6% of women. Meanwhile, 14.2% of women and 5.5% of men have obesity.

Notes: Data on the adult indicators are based on modelled estimates.
