Country overview

Malnutrition burden

Rwanda is on course to meet the global targets for under-five overweight, under-five wasting, and infant exclusive breastfeeding, but is off course to meet the targets for all other indicators analysed with adequate data.

Rwanda experiences a malnutrition burden among its under-five population. As of 2015, the national prevalence of under-five overweight is 7.9%, which has increased slightly from 6.9% in 2010. The national prevalence of under-five stunting is 38.2%, which is greater than the developing country average of 25%. Conversely, Rwanda’s under-five wasting prevalence of 2.3% is less than the developing country average of 8.9%.

In Rwanda, 86.9% of infants under 6 months are exclusively breastfed. Rwanda’s 2015 low birth weight prevalence of 7.9% has decreased slightly from 10.3% in 2000.

Rwanda’s adult population also face a malnutrition burden. 22.3% of women of reproductive age have anaemia, and 4.5% of adult women have diabetes, compared to 4.3% of men. Meanwhile, 9.3% of women and 1.9% of men have obesity.

Notes: Data on the adult indicators are based on modelled estimates.

Progress against global nutrition targets 2019

Notes: WRA = Women of a reproductive age; NA = not applicable. The methodologies for tracking differ between targets. Data on the adult indicators are based on modelled estimates.
Child (under-five) nutrition status

Coexistence of wasting, stunting and overweight

Notes: Percentage of children under-five years of age who experience different and overlapping forms of malnutrition.

Prevalence of under-five stunting

Stunting at subnational level

Notes: 5 km level map shows prevalence at the 5 x 5-km resolution. Prevalence is the 2017 estimated prevalence, based on a model using a range of surveys between 1998-2018. See source paper for full methods.
