Country overview

Malnutrition burden

Senegal is on course to meet the global target for under-five overweight, but is off course to meet the targets for all other indicators analysed with adequate data.

Although it performs relatively well against other developing countries, Senegal still experiences a malnutrition burden among its under-five population. As of 2017, the national prevalence of under-five overweight is 0.9%, which has remained constant since 2016. The national prevalence of under-five stunting is 16.5%, which is less than the developing country average of 25%. Conversely, Senegal’s under-five wasting prevalence of 9% is greater than the developing country average of 8.9%.

In Senegal, 42.1% of infants under 6 months are exclusively breastfed, this is well above the Western Africa average of 32.5%. Senegal’s 2015 low birthweight prevalence of 18.5% has decreased from 22% in 2000.

Senegal’s adult population also face a malnutrition burden. 49.9% of women of reproductive age have anaemia, and 7.5% of adult men have diabetes, compared to 7.3% of women. Meanwhile, 12.9% of women and 4% of men have obesity.

Notes: Data on the adult indicators are based on modelled estimates.

Progress against global nutrition targets 2019

Notes: WRA = Women of a reproductive age; NA = not applicable. The methodologies for tracking differ between targets. Data on the adult indicators are based on modelled estimates.
Child (under-five) nutrition status

Coexistence of wasting, stunting and overweight

Notes: Percentage of children under-five years of age who experience different and overlapping forms of malnutrition.

Low birth weight

No data

Prevalence of under-five stunting

Stunting at subnational level

Stunting at 5km level

Notes: 5 km level map shows prevalence at the 5 x 5-km resolution. Prevalence is the 2017 estimated prevalence, based on a model using a range of surveys between 1998-2018. See source paper for full methods.
